

Exercise 1

- Start by running the “hello world” to learn structure of Charm4Py programs and how to run them
- Then complete the primes and fibonacci exercises

Primality detection

- Determine the primality of K random positive integers
- Get K from command line
- For a certain group of numbers, create a chare
 - Vary the number of chares on the command line, and assign numbers to groups accordingly
- Within each chare, use `isPrime` function to find primality of that number

Fibonacci

- Compute the Fibonacci sequence recursively
- Given $F_n = F_{n-1} + F_{n-2}$, create chares to compute $n-1$ and $n-2$ terms
- Use futures to wait for inputs, then compute F_n
- Not the most efficient algorithm, but demonstrates use of futures
- Template provided, need to fill in details
